After seeing the video,

-Frustrating how it should pass through every link and tab in the website.

-I found out that the most important part for the web developer that should have not only a screen reader but also a website that makes the navigation faster and easier for people with disability to navigate with; for example jumping from header to nav tab without going through all the items in the web.

-I was surprised actually by the screen reader and how it talks so fast, I wouldn't understand it. This may be adjusted by the users.

-I liked how when he started typing the reader was helping to make sure he writing the right

 letters.
